

Prüfung grösserer Zahlen auf ihre Eigenschaft als Primzahlen.

(FORTSETZUNG VON VOL. VII, NRO. 3.)

VON P. SEELHOFF.

Als Fortsetzung meiner Ausführungen in Nro. 3 gebe ich zunächst eine tabellarische Zusammenstellung von 192 negativen Determinanten. Die Tabelle besteht aus 3 Kolonnen. Die erste mit der Aufschrift *D* giebt die Determinanten selbst, die zweite die daraus abgeleiteten Hauptformen (*Formae principales*) und die dritte den Gesamtcharakter dieser Formen. Als wesentlichste und für den vorliegenden Zweck nothwendige Eigenschaft dieser Hauptformen soll noch einmal hervorgehoben werden, dass neben ihnen keine anderen reducirten Formen mit demselben Gesamtcharakter bestehen. Die Bezeichnung der einzelnen Charaktere $3n + r$, $3n - r$, etc. bedeutet, dass die Zahl *N*, welche dargestellt werden soll, für 3 etc. quadratischer Rest, resp. Nichtrest ist. Haben mehrere Formen denselben Gesamtcharakter, so ist dieser nur bei der ersten Form ausführlich angegeben.

Eine auch für die Zahltypen $8n + 3$, $8n + 5$ und $8n + 7$ durchgeführte Sonderung der Formen erschien mir nicht zweckmässig, weil hierdurch zu viele Wiederholungen nothwendig würden, und wenn ich nach eigener Erfahrung urtheilen darf, so ist die jetzt gewählte Zusammenstellung für den Gebrauch von hinreichender Uebersichtlichkeit.

Ich möchte dies an einem Beispiele nachweisen, welches mir zugleich Gelegenheit geben wird, das in dem früheren Aufsätze über das Verfahren Beigebrachte in einzelnen Punkten zu ergänzen.

Herr J. W. L. Glaisher in Cambridge äussert sich in einem seiner Aufsätze, wie folgt: "The process of determining without a table the factors of a number is excessively laborious. Thus to determine, for example, whether the number 8559091 is or not a prime would require a long day's work." Sehen wir zu!

Es findet sich sofort, dass diese Zahl N quadratischer Rest für 3, 5, 7, 17, 19, 23, dagegen Nichtrest für 11, 13, 29, 31 ist. Unter den Formen, für welche sich einige dieser Charaktere in Verbindung mit dem besonderen Charakter $8n + 3$ vereinigt finden, wähle ich die beiden Hauptformen (15, 0, 364) und (60, 0, 91) der Determinante -5460 , für welche mein hat $3n + r$, $5n + r$, $7n + r$, $13n - r$; $8n + 3$, 7,

$$1. \quad 15a + 364b = N$$

Da $N \equiv 1 \pmod{15}$, $364 \equiv 4 \pmod{15}$ und $4 \cdot 4 \equiv 1 \pmod{15}$ ist, so subtrahire ich $364 \cdot 4$ von N und dividire durch 15. Dann ist

$$a = 575509 - 364k$$

$$b = 4 + 15k.$$

Ferner hat man $575509 \equiv 4 \pmod{7}$, $\equiv 12 \pmod{13}$; setzt man demnach

$$15x^2 + 364y^2 = N,$$

so ist $x = 4t \pm 1 = 7u \pm 2 = 13v \pm 5$ und weil $\sqrt{575509} = 758$ die obere Grenze bildet

$$x = \begin{matrix} 5, & 47, & 135, & 177, & 187, & 229, & 317, & 359, \\ 369, & 411, & 499, & 541, & 551, & 593, & 681, & 723, \\ 733. \end{matrix}$$

Leitet man hieraus mit Hülfe von Quadratzahlentafeln k und in zweiter Linie b ab, so wird letzteres für keinen dieser Werte ein Quadrat.

$$2. \quad 60a + 91b = N.$$

Aehnlich wie oben findet man

$$a = 142650 - 91k$$

$$b = 1 + 60k$$

$$x = \begin{matrix} 12, & 40, & 51, & 79 \\ 103, & 131, & 142, & 170 \\ 194, & 222, & 233, & 261 \\ 285, & 313, & 324, & 362 \\ 376. \end{matrix}$$

Nur für $x = 376$ ist b oder $y^2 =$ einem Quadrate, nämlich $841 = 29^2$. Also ist $8559093 = 60 \cdot 376^2 + 91 \cdot 29^2$ eine Primzahl.

Ich muss ferner auf das in dem ersten Artikel gesagte noch in einer anderen Beziehung zurückkommen. An ein oder zwei Stellen, wo es sich um mehrere Hauptformen mit gemeinschaftlichem Gesamtcharakter handelt, war meine Ausdrucksweise vielleicht nicht genau genug, ich gestatte mir deshalb, um jedem Misverständnisse vorzubeugen, noch einige Worte.

Aus der Determinante — 1012 lassen sich, um ein Beispiel anzuführen folgende Hauptformen ableiten.

$$\begin{Bmatrix} 1, & 0, & 1012 \\ 4, & 0, & 253 \end{Bmatrix} \text{ und } \begin{Bmatrix} 11, & 0, & 92 \\ 23, & 0, & 44 \end{Bmatrix}.$$

Die beiden Formen in der ersten Klammer haben denselben Gesamtcharakter, ebenso die beiden in der zweiten Klammer. Nennt man nun nach Gauss einen solchen Complex von Formen mit demselben Gesamtcharakter eine Gattung (genus), so ergibt sich für sämtliche 192 Determinanten folgendes: Erhält man aus *sämtlichen* Formen einer Gattung nur eine Darstellung der Zahl N , so ist diese eine Primzahl; erhält man keine Darstellung, so ist N zusammengesetzt. Erhält man mehr als eine Darstellung für eine und dieselbe Form oder auch für mehrere der Gattung angehörige, so lässt sich aus einem Paare solcher Darstellungen ein Paar Faktoren von N ableiten.

Wie dies geschehen kann für den Fall, dass beide Darstellungen durch dieselbe Form gebildet werden, habe ich in dem ersten Artikel nach dem Vorgange Eulers gezeigt; es bleibt also noch der andere Fall übrig, dass zwei verschiedene Formen zur Darstellung dienen. Sei also für die Determinante — mnp

$$mnx^2 + py^2 = N \quad (1)$$

$$m\xi^2 + n\eta^2 = N \quad (2)$$

so multiplicire man (2) mit nx^2 und (1) mit ξ^2 , dann ist

$$mn(\xi x)^2 + p(\xi y)^2 = \xi^2 N$$

$$mn(\xi x)^2 + p(n\eta x)^2 = nx^2 N$$

und hieraus

$$p\{(\xi y)^2 - (n\eta x)^2\} = (\xi^2 - nx^2) N.$$

Bestimmt man jetzt noch den grössten gemeinschaftlichen Divisor von $\xi y + n\eta x$ oder $\xi y - n\eta x$ und N , so ist dieser einer der gesuchten Divisoren.

BREMEN im Mai 1885.
